

## <h1> - <h6>

Headings <h1> through <h6> are ordered from the most to the least important, so <h1> is usually larger than <h6>.

Code example:

```
<h1>This is heading 1</h1>
<h2>This is heading 2</h2>
<h3>This is heading 3</h3>
<h4>This is heading 4</h4>
<h5>This is heading 5</h5>
<h6>This is heading 6</h6>
```

## <p>

Paragraph

Code example:

```
<p>This is a paragraph.</p>
<p>This is another paragraph.</p>
<p>Wait! Another paragraph?</p>
```

## <br>

Line break is an empty tag that inserts a single line break, useful for formatting text in a paragraph.

Code example:

```
This text contains<br>a line break.
```

## <pre>

Preformatted text preserves spaces and line breaks and is usually displayed in a fixed-width font.

Code example:

```
<pre>
Text in a pre element
is displayed in a fixed-width
font, and it preserves
both      spaces and
line breaks
</pre>
```

# This is heading 1

## This is heading 2

### This is heading 3

#### This is heading 4

##### This is heading 5

###### This is heading 6

This is a paragraph.

This is another paragraph.

Wait! Another paragraph?

This text contains  
a line break.

```
Text in a pre element
is displayed in a fixed-width
font, and it preserves
both      spaces and
line breaks
```

## <em>

Emphasized text is shown in italic and intended to stand out from the rest of the paragraph, as if it was in a different mood or voice.

Code example:

```
Cats are <em>cute</em> animals.
```

Cats are *cute* animals

## <strong>

Important text can be used to distinguish the strong importance, seriousness, or urgency of some parts of text over other parts.

Code example:

```
<strong>Flowers, Bees, and Honey</strong> and other things I don't understand
```

**Flowers, Bees, and Honey** and other things I don't understand

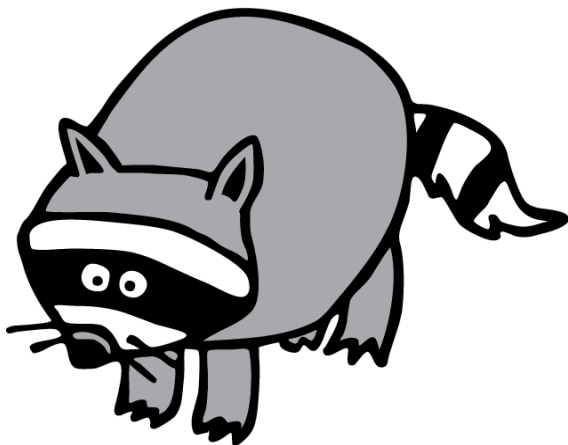

## <img>

Image, specify only the width or the height if you do not want to "stretch" the image

Code example:

```

```

## <ul>

Unordered (bulleted) list

## <li>

List item

Code example:

```
<ul>
  <li>Coffee</li>
  <li>Tea</li>
  <li>Milk</li>
</ul>
```

- Coffee
- Tea
- Milk

## <ol>

Ordered list, can be numerical or alphabetical

Code example:

```
<ol>
  <li>Coffee</li>
  <li>Tea</li>
  <li>Milk</li>
</ol>
```

1. Coffee
2. Tea
3. Milk

## <a>

Anchor is used to link to another page or location. A link is normally displayed in the current tab/window unless another target is set.

Code examples:

```
<a target="_blank" href="https://www.w3schools.com">W3Schools.com</a>
```

```
<a href="#location-in-page">Go to page location</a>
```

```
<h1 id="location-in-page">Here You Are!</a>
```

## HTML comments

Use comments in html to describe or leave notes in the code or to "comment out" code.

Code example:

```
<!-- this is a comment -->
```

## <div>

Div stands for division, a section or “division” of the document. Displays block by default, meaning it creates a line break before and after the div.

Code examples:

```
<div style="background-color:lightblue">
  <h3>This is a heading</h3>
  <p>This is a paragraph.</p>
</div>
```

## <span>

Span is used to group inline text or elements in an html document. Does not extend outside of block elements such as div, paragraph, and heading.

Code examples:

My mother has <span style="color:blue">blue</span> eyes.
